MOM(10):

-This meeting had started at 4:00 pm and we had finished at 8:00 Pm.

-We bought a sketch and made our track on it with the required dimensions.

-We detected some errors in the Arduino code and started to modify it

-The first problem which we had faced was when the two sensors had turned lights out (they saw two black tracks) so we added the Forward Right code and Forward left.

-The second problem was when we added the stop option of the car when all the sensors had turned their lights on.

-We have faced some errors in the car moving on the track as the sensors didn't work together properly at the first time.
